OMB No. 0704-0188

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Washington Headquarters Service, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302, and to the Office of Management and Budget, Paperwork Reduction Project (0704-0188) Washington, DC 20503.

PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

1. REPORT DATE (DD-MM-YYYY) 00-11-2001		2. REPORT DATE NOVEMBER 2001		3. DATES COVERED (From - To) 1996-1999	
4. TITLE AND SUBTITLE FINAL TECHNICAL REPORT Reliability Assessment of ship structures Against Fatigue				5a. CONTRACT NUMBER	
				5b. GRANT NUMBER N00014-96-1-0641	
				5c. PROGRAM ELEMENT NUMBER	
6. AUTHOR(S)				5d. PROJECT NUMBER	
				5e. TASK NUMBER	
				5f. WORK UNIT NUMBER	
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES) RMS GROUP S.R. WINTERSTON & C.A. Cornell Blume Center Stanford University, CA 94305				8. PERFORMING ORGANIZATION REPORT NUMBER 2-ddz-400	
9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES) OFFICE OF NAVAL RESEARCH 800 North QUINCY ST. ARLINGTON, VA 22217-4620 ATTN: ROHDY BARSOUM				10. SPONSOR/MONITOR'S ACRONYM(S)	
				11. SPONSORING/MONITORING AGENCY REPORT NUMBER	
12. DISTRIBUTION AVAILABILITY STATEMENT APPROVED FOR PUBLIC RELEASE					
13. SUPPLEMENTARY NOTES					
14. ABSTRACT This report outlines the project technical goals and strategy to approach the reliability assessment from 3 technical directions: 1) Direct prediction of fatigue damage, 2) Prediction of exceeding specified load thresholds, and 3) Simulation and prediction of Ocean waves.

Final Technical Report
Reliability Assessment of Ship Structures against Fatigue
ONR Grant Number: N00014-96-1-0641
Stanford: 2-ddz-400

The accomplishments of the research project are advancements in the state of knowledge in the reliability assessment of ship structures against fatigue. Fatigue life of ship structural components is believed sensitive to load events exceeding certain thresholds. Ocean waves are known to be the dominant source of fatigue in ship structures. Thus, this fatigue investigation has spanned three technical areas: direct prediction of fatigue damage in non-Gaussian load environments, prediction of probability of exceeding specified load thresholds in non-Gaussian environments, and simulation and prediction of non-linear, non-Gaussian ocean waves. Some of the methods developed are applicable to many different structural types beyond ship structural components. In these cases, the methods have been additionally tested and verified against wind-turbine fatigue data because turbine-blade fatigue data was available to the project.

In the predicting fatigue damage in non-Gaussian load environments, research has concentrated on the fitting of up to three statistical models to observed load data and on application of these models to predict long-term fatigue accumulation from short-term observed data. A broad variety of statistical models have been fit using the method of moments, and the resulting models have been tested against measured data for ship fatigue and for wind-turbine blade fatigue applications.

In the prediction of exceeding specified load thresholds, use of four-moment Hermite models, analytic formulae, first-order reliability method (FORM), statistical bootstrapping methods, and fitting of various statistical models have all been proposed and tested against measured physical data. Numerical algorithms in the form of computer software have been developed as in an effort to more fully understand these phenomena. Example applications have included prediction of extreme statistics of wind-driven ocean waves, and of motions of a spar production platform subject to these waves.

In the prediction of non-linear non-Gaussian ocean waves, a methodology has been developed to simulate second-order random ocean waves to match a target sea spectrum. The inverse has also been developed: identifying the first- and second-order components underlying a specified wave time-history. The results of both the simulation and identification methodologies can be used to predict consistent wave time-histories at other spatial locations. Results of this methodology have been verified against observed wave time-histories both from field data and from model test measurements.

Reports of these methods and results have been documented in numerous papers and reports. The reports generated from research funded by this project are:
